TECHNICAL ASSESSMENT

2

RULE – BASED AGENT

Student Name	Vignesh Lyndon Vinod G. Gopal
Section:	AN43
Professor:	Ms Crisola, B. Tan
Date:	Oct 14, 2026

I. BACKGROUND INFORMATION

A Rule-Based Agent is a type of intelligent agent that operates by following predefined rules to decide its actions. In this lab, students will work with a vacuum cleaner agent that can clean rooms or move between rooms depending on their state (dirty or clean).

The goal is to understand how agents perceive the environment, act according to rules, and update the environment.

II. TECHNICAL ASSESSMENT

RULE – BASED AGENT

Objective

At the end of this laboratory activity, students are expected to:

1. Explain the concept of rule-based agents.
2. Implement a rule-based agent in Python.
3. Interact with an environment by perceiving and acting based on rules.
4. Observe and analyze the behavior of an agent in a controlled environment.

Materials Needed

- Computer with Python 3.x installed
- Text editor or IDE (e.g., VSCode, PyCharm)
- Optional: Jupyter Notebook for interactive testing

General Instructions

1. This **Technical Assessment (TA4)** must be completed individually.
2. Follow the Task below.
3. Include clear comments in your code to describe its logic.
4. Each program should display the correct input, process, and output.
5. Ensure that your script displays clear and readable outputs.
6. Compile all Python codes and corresponding outputs into one PDF file.
7. Save it as **TA2_lastname.pdf**
   (Example: TA2_Patilano.pdf)
8. Submit the **python file** and **PDF** file.

Laboratory Task

Pre-Lab Preparation

1. Review the Python concepts:
   - Classes and objects
   - If-Else statements

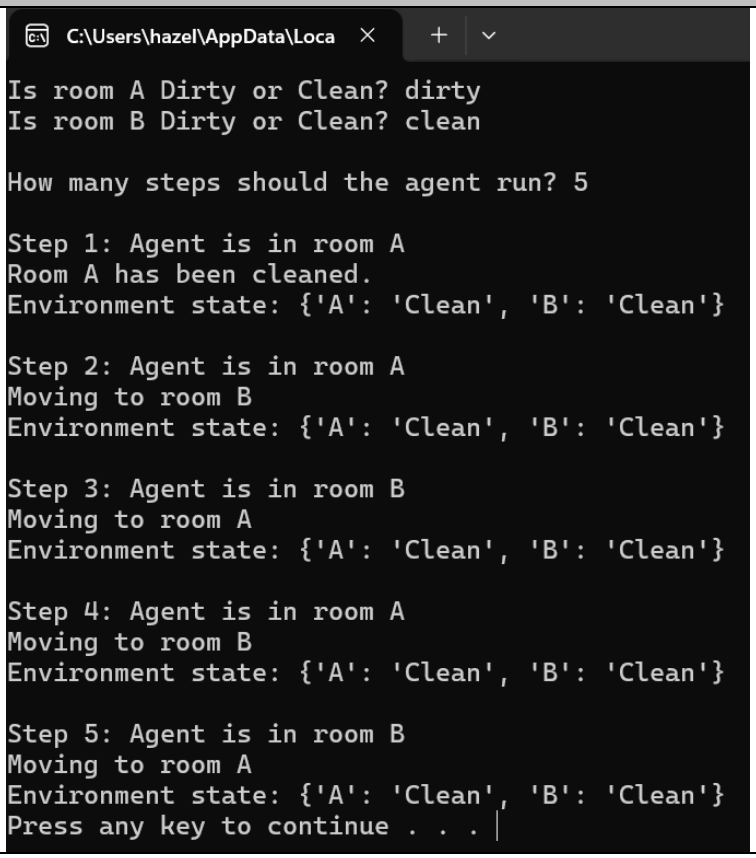

- Loops (for loop)
- Functions / methods

2. Understand the environment:
   - Two rooms: A and B
   - Each room can be Dirty or Clean

Task 1: Set Up the Environment

1. Initialize two rooms using a Python dictionary.
2. Allow the user to set the **initial state** of each room (dirty or clean).
3. Write a function to **check if a room is dirty** and a function to **clean a room**.

Sample Output

Task 2: Implement the Rule-Based Agent

1. Create a class for the agent.
2. Implement the **perceive-and-act method**:
   - Rule 1: If the current room is dirty, clean it.
   - Rule 2: If the current room is clean, move to the other room.
3. Implement a **move method** to switch rooms.

Task 3: Run the Simulation

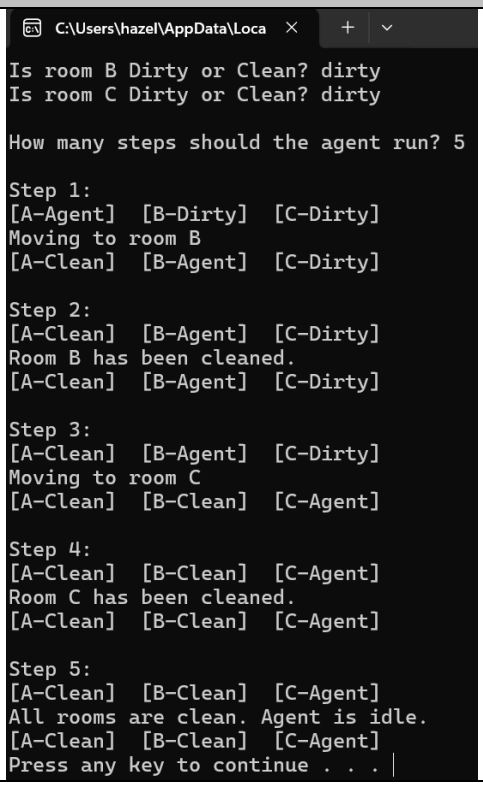

1. Ask the user how many steps the simulation should run.
2. Run the agent in a loop for the specified steps.

3. After each step, print:
    - The agent's current location
    - The action taken (cleaned/moved)
    - Current state of the environment

Optional (Bonus Task)

- Add a **third room (C)** and update the agent logic.
- Make the agent **randomly choose which dirty room to clean next**.
- Visualize the agent moving between rooms using a **text-based grid**.

Sample Output (Bonus Task)

Your Code - Laboratory Tasks ⇩

```
def get_initial_state(room_name):
    while True:
        state = input(f"Is room {room_name} Dirty or Clean? ").strip().lower()
        if state in {"dirty", "clean"}:
            return state.capitalize()
        print("Please enter only 'dirty' or 'clean'.")

def is_dirty(environment, room_name):
```

```
    return environment[room_name] == "Dirty"

def clean_room(environment, room_name):
    if is_dirty(environment, room_name):
        environment[room_name] = "Clean"
        return True
    return False

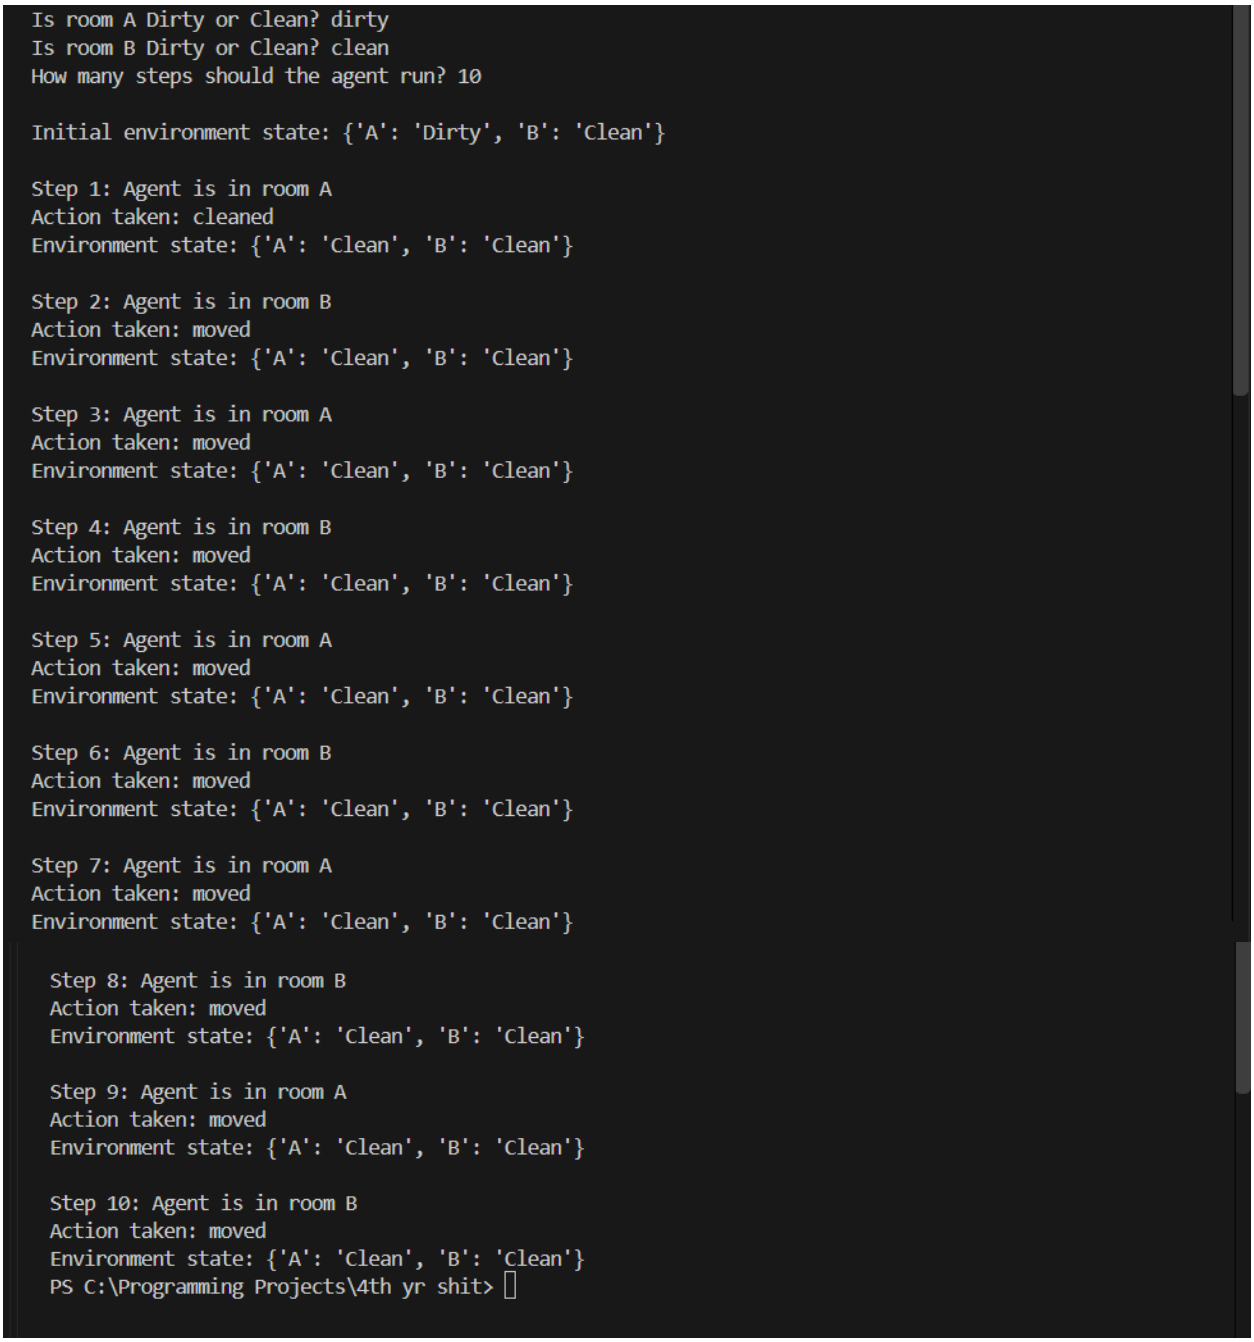

def main():
    environment = {
        "A": get_initial_state("A"),
        "B": get_initial_state("B"),
    }

    print("\nInitial environment state:", environment)

    for room_name in environment:
        if is_dirty(environment, room_name):
            print(f"Room {room_name} is dirty. Cleaning it...")
            clean_room(environment, room_name)
        else:
            print(f"Room {room_name} is already clean.")

    print("Final environment state:", environment)

if __name__ == "__main__":
    main()
```

Task 4: Analysis Questions

After running the simulation, answer the following:

1. What rules does the agent follow?
2. How does the agent decide when to clean and when to move?
3. What happens if both rooms are already clean at the start?
4. How would you modify the agent to handle **more than two rooms**?

Answer the Questions ⇩

1. The agent follows only two rules in this activity, if the room is dirty it cleans the room and if the room is already clean it moves onto the other
2. It calls the function is_dirty() to check the status of the room, if the room is clean then it calls upon move() to move onto the next room
3. Then the agent will move between rooms for every step as both rooms are already clean.
4. Keep a list or a dictionary to handle more than 2 rooms
